                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 6;

         Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                     The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains.
                                                                                                                                                                                                                      Claim 5; Page 37; 41pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; high molecular weight kininogen; glycoprotein; endothelial cell; plasma kallikrein; heavy chain; light chain; analogue; angiogenesis; endothelial cell proliferation; endothelial cell migration; vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fragment 1, amino acids 458-520. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent component. The fragments are useful in wound treating because they have growth promotion activity
                                                                                                                                                                                                                                                   Method for inhibiting endothelial cell proliferation, using compound that inhibit endothelial cell migration

                   Human high molecular weight kininogen domain 5
                                                                                                                                                               AAY81995 standard; peptide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR75181 is a partial peptide corresponding to human kininogen fragment 1.2, amino acids 390-520. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compons. and act as the active component. The fragments are useful in wound treating because they have growth promotion activit

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising part or all of the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell proliferation or by inducing endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis

                          The present peptide, and its claimed fragments, are derived from residues 402-498 of the human high polymer quininogen L-chain are useful in cell adhesion, cancer metastasis or platelet aggregation inhibitors, and in wound, inflammatory disease, arteriosclerosis or glomerular nephritis treating agents. The present peptide was synthesised using a solid phase method, and purified using a YMC-DOS-120A-S15/13 column.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR75178 is a partial peptide corresponding to bovine kininogen fragment 1.2, amino acids 387-496. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compons. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity
                                                                                                                                                                                                                     Cell adhesion inhibiting peptide(s), used as cancer metastasis

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                          Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a composition for inhibiting angiogenesis. Angiogenesis coccurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation on by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

           The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting engothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used for inhibiting engothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                               (DUPO)
                                                                                                                                                                                                                                                                                                   Colman WR,

The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cells with method and the compounds can be used for the inhibition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Method for inhibiting endothelial cell proliferation, using compound that inhibit endothelial cell migration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Colman WR,

The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for

Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compsus. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

                                                                                        The present sequence represents the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                  Sequence

                                      The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kbm glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used to used for inhibiting angiogenesis. The compounds can also be used to

                              Human two-chain high molecular weight kininogen domain 5 fragment #7
                                                                                                                        AAY81998 standard;
                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a fragment of the light chain of huma high molecular weight kininogen. It is used to produce compounds of the invention. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

HKa is product of high molecular weight kininogen (HK) cleavage by plasma kallikrein. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting anglogenesis. Anglogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may joint destruction by inhibiting endothelial cell proliferation or by inducing endothelial cell proliferation or by inducing endothelial cell proliferation the composition may be recombinant peptides, and tural peptides, or synthetic peptides. They may also be chemically extracted using for example cells become where the stated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A pharmaceutical composition used to inhibit angiogenesis, inhibit endothelial cell proliferation, and induce endothelial cell apoptosis

                             ARR75179 is a partial peptide corresponding to bovine kininogen fragment 2, amino acids 456-496. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compsns. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

                                                                                                                            AAR75178 is a partial peptide corresponding to bovine kininogen fragment 1.2, amino acids 387-496. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compsns. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity
                                                                                               Sequence
                                                                                                                     on fibroblasts.
                                                                                                                                                                                               Claim
                                                                                                                                                                                                                   A wound treating agent contg. a partial peptide of kininogen have growth promotion activity of fibroblasts.
                                                                                                                                                                                                                                                    WPI; 1995-158909/21.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a
                                                                                                  Claim
                                                                                                                                                    A pharmaceutical composition used to inhibit angiogenesis, inhibit endothelial cell proliferation, and induce endothelial cell apoptosis
                                                                                                                                                                                                                   WPI; 2000-376483/32
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       two-chain high molecular weight kininogen; HKa;
angiogenesis inhibition; tumour; cancer; ocular disorder;
rheumatoid arthritis; endothelial cell apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is derived from human two-chain high molecular weight kininogen (HKa) domain 5. HKa is product of high molecular weight kininogen (HK) cleavage by plasma kallikrein. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell approach section of synthetic peptides. They may also be chemically expressed in the composition for the beautiful cell in the composition of the composition of the composition of the composition may be recombinant peptides.

high molecular weight kininogen. It is used to produce compounds of the invention. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for
                                                                                                                                                                          Claim 3; Page 36; 41pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the compostion may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis

                                                                        The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting anglogenesis. The compounds can also be used for inhibiting anglogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

                                                                                                                                           The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                         AAY93351;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   that

High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to

                                                                                      The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kbm glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

                                                                                                                                                                                                                                                                                       The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for inhibiting endothelial cell proliferation, using compound that inhibit endothelial cell migration -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; high molecular weight kininogen; glycoprotein; endothelial cell; plasma kallikrein; heavy chain; light chain; analogue; angiogenesis; endothelial cell proliferation; endothelial cell migration; vitronectin

High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the high molecular and the compounds can be used for the property of the compounds can be used for the property of the compounds can be used for the property of the compounds can be used for the property of the compounds can be used for the property of the compound containing the compounds can be used for the property of the compound containing the containing the compound containing the containing t

        The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising part or all of the present

The present sequence is that of a mouse haematopoietic stem cell (HSC) specific protein. It is an example of claimed HSC-specific proteins (see AAY9176-93) predicted from novel isolated HSC-specific nucleic acids (see AAZ94077-131). The HSCs are especially primitive HSCs (PHSCs) such as umbilical cord cells, bone marrow cells and foetal liver cells. The encoded proteins are growth factors, transport proteins, translation factors or replication factors that modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It calso occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid

CC HSC activity, especially differentiation or replication. The CC invention provides claimed methods: for identifying PHSC-specific CC nucleic acids; for generating a stem cell/progenitor cell from CC PHSCs; for identifying the presence of a PHSC in a sample; for CC identifying the presence in a sample of a compound that modulates CC HSC activity; for using such a compound to compound that modulates CC acid into a HSC; and for ex vivo expansion of HSCs. Also claimed CC are vectors, host cells, and an antibody that specifically binds a XX Squence 631 AA;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
